Chapter 1

Introduction

1.1 Why CddInterface

We know that every convex polyhedron has two representations, one as the intersection of finite half-spaces and the other as Minkowski sum of the convex hull of finite points and the nonnegative hull of finite directions. These are called H-representation and V-representation, respectively.
CddInterface is a gap interface to the C package **cddlib** which among other things can translate between these two representations.

1.2 H-representation and V-representation of polyhedra

Let us start by introducing the H-representation. Let A be $m \times d$ matrix and let b be a column m-vector. The H-representation of the polyhedron defined by the system $b + Ax \geq 0$ of m inequalities and d variables $x = (x_1, \ldots, x_d)$ is as follows:

H-representation
linearity t, $[i_1, i_2, \ldots, i_t]$
begin
$m \times (d+1)$ numbertype
$b \qquad A$
end

The linearity line is added when we want to specify that some rows of the system $b + Ax$ are equalities. That is, $k \in \{i_1, i_2, \ldots, i_t\}$ means that the row k of the system $b + Ax$ is specified to be equality.

For example, the H-representation of the polyhedron defined by the following system:

$$4 - 3x_1 + 6x_2 - 5x_4 = 0, 1 + 2x_1 - 2x_2 - 7x_3 \geq 0, -3x_2 + 5x_4 = 0$$

is the following:

H-representation
linearity 2, $[1, 3]$
begin
3×5 rational
4	-3	6	0	-5
1	2	-2	-7	0
0	0	-3	0	5

end

Next we define Polyhedra V-format. Let P be represented by n gerating points and s generating directions (rays) as

$$P = \text{conv}(v_1, \ldots, v_n) + \text{nonneg}(r_{n+1}, \ldots, r_{n+s}).$$

Then the Polyhedra V-format is for P is:

V-representation
linearity t, $[i_1, i_2, \ldots, i_t]$
begin
$(n+s) \times (d+1)$ numbertype

1	v_1
$\vdots$	$\vdots$
1	v_n
0	r_{n+1}
$\vdots$	$\vdots$
0	r_{n+s}

end

In the above format the generating points and generating rays may appear mixed in arbitrary order. Linearity for V-representation specifies a subset of generators whose coefficients are relaxed to be free. That is, $k \in \{i_1, i_2, ..., i_t\}$ specifies that the k-th generator is specified to be free. This means for each such a ray r_k, the line generated by r_k is in the polyhedron, and for each such a vertex v_k, its coefficient is no longer nonnegative but still the coefficients for all v_i's must sum up to one.

For example the V-representation of the polyhedron defined as

$$P := \text{conv}((2,3), (-2,-3), (-1,2)) + \text{nonneg}((1,2), (-1,-2), (1,1))$$

V-representation
linearity 2, $[1, 3]$
begin
4×3 numbertype

1	2	3
1	-1	2
0	1	2
0	1	1

end

Chapter 2

Creating polyhedra and their Operations

2.1 Creating a polyhedron

2.1.1 Cdd_PolyhedronByInequalities

▷ Cdd_PolyhedronByInequalities(*ineq[, linearities_list]*) (function)

    Returns: a CddPolyhedron

    The function takes a list in which every entry represents an inequality (or equality). In case we want some entries to represent equalities we should refer in a second list to their indices.

```
───────────────────────── Example ─────────────────────────
gap> A:= Cdd_PolyhedronByInequalities( [ [ 0, 1, 0 ], [ 0, 1, -1 ] ] );
<Polyhedron given by its H-representation>
gap> Display( A );
H-representation
begin
   2 X 3  rational

   0   1   0
   0   1  -1
end
gap> B:= Cdd_PolyhedronByInequalities( [ [ 0, 1, 0 ], [ 0, 1, -1 ] ], [ 2 ] );
<Polyhedron given by its H-representation>
gap> Display( B );
H-representation
linearity 1, [ 2 ]
begin
   2 X 3  rational

   0   1   0
   0   1  -1
end
```

2.1.2 Cdd_PolyhedronByGenerators

▷ Cdd_PolyhedronByGenerators(*genes[, linearities_list]*) (function)

    Returns: a CddPolyhedron

The function takes a list in which every entry represents a vertex in the ambient vector space. In case we want some vertices to be free (the vertex and its negative belong to the polyhedron) we should refer in a second list to their indices .

─────────────────── Example ───────────────────
```
gap> A:= Cdd_PolyhedronByGenerators( [ [ 0, 1, 3 ], [ 1, 4, 5 ] ] );
<Polyhedron given by its V-representation>
gap> Display( A );
V-representation
begin
   2 X 3  rational

   0  1  3
   1  4  5
end
gap> B:= Cdd_PolyhedronByGenerators( [ [ 0, 1, 3 ] ], [ 1 ] );
<Polyhedron given by its V-representation>
gap> Display( B );
V-representation
linearity 1, [ 1 ]
begin
   1 X 3  rational

   0  1  3
end
```

2.2   Some operations on a polyhedron

2.2.1   Cdd_FourierProjection (for IsCddPolyhedron, IsInt)

▷ Cdd_FourierProjection(*P, i*)   (operation)
   Returns: a CddPolyhedron

The function returns the Fourier projection of the polyhedron in the subspace $(O, x_1, \ldots, x_{i-1}, x_{i+1}, \ldots, x_n)$ after applying the Fourier elemination algorithm to get rid of the variable x_i.

To illustrate this projection, Let $P = \text{conv}((1,2),(4,5))$ in $\mathbb{Q}^2$.

To find its projection on the subspace (O, x_1), we apply the Fourier elemination to get rid of x_2

─────────────────── Example ───────────────────
```
gap> P := Cdd_PolyhedronByGenerators( [ [ 1, 1, 2 ], [ 1, 4, 5 ] ] );
<Polyhedron given by its V-representation>
gap> H := Cdd_H_Rep( P );
<Polyhedron given by its H-representation>
gap> Display( H );
H-representation
linearity 1, [ 3 ]
begin
   3 X 3  rational

    4  -1   0
   -1   1   0
   -1  -1   1
```

```
end
gap> P_x1 := Cdd_FourierProjection( H, 2);
<Polyhedron given by its H-representation>
gap> Display( P_x1 );
H-representation
linearity 1, [ 3 ]
begin
   3 X 3  rational

    4  -1   0
   -1   1   0
    0   0   1
end
gap> Display( Cdd_V_Rep( P_x1 ) );
V-representation
begin
   2 X 3  rational

   1  1  0
   1  4  0
end
```

Let again $Q = Conv((2,3,4),(2,4,5)) + nonneg((1,1,1))$, and let us compute its projection on (O, x_2, x_3)

```
                           Example
gap> Q := Cdd_PolyhedronByGenerators( [ [ 1, 2, 3, 4 ],[ 1, 2, 4, 5 ], [ 0, 1, 1, 1 ] ] );
<Polyhedron given by its V-representation>
gap> R := Cdd_H_Rep( Q );
<Polyhedron given by its H-representation>
gap> Display( R );
H-representation
linearity 1, [ 4 ]
begin
   4 X 4  rational

    2   1  -1   0
   -2   1   0   0
   -1  -1   1   0
   -1   0  -1   1
end
gap> P_x2_x3 := Cdd_FourierProjection( R, 1);
<Polyhedron given by its H-representation>
gap> Display( P_x2_x3 );
H-representation
linearity 2, [ 1, 3 ]
begin
   3 X 4  rational

   -1   0  -1   1
   -3   0   1   0
    0   1   0   0
end
```

```
gap> Display( Cdd_V_Rep( last ) ) ;
V-representation
begin
   2 X 4  rational

   0   0   1   1
   1   0   3   4
end
```

2.3 Some operations on two polyhedrons

2.3.1 Cdd_IsContained (for IsCddPolyhedron, IsCddPolyhedron)

▷ Cdd_IsContained(*P1, P2*)   (operation)

Returns: `true` or `false`

The function returns `true` if P_1 is contained in P_2, otherwise returns `false`.

```
———————————— Example ————————————
gap> A := Cdd_PolyhedronByInequalities( [ [ 10, -1, 1, 0 ],
> [ -24, 9, 2, 0 ], [ 1, 1, -1, 0 ], [ -23, -12, 1, 11 ] ], [ 4 ] );
<Polyhedron given by its H-representation>
gap> B := Cdd_PolyhedronByInequalities( [ [ 1, 0, 0, 0 ],
> [ -4, 1, 0, 0 ], [ 10, -1, 1, 0 ], [ -3, -1, 0, 1 ] ], [ 3, 4 ] );
<Polyhedron given by its H-representation>
gap> Cdd_IsContained( B, A );
true
gap> Display( Cdd_V_Rep( A ) );
V-representation
begin
   3 X 4  rational

   1   2   3   4
   1   4  -6   7
   0   1   1   1
end
gap> Display( Cdd_V_Rep( B ) );
V-representation
begin
   2 X 4  rational

   1   4  -6   7
   0   1   1   1
end
```

2.3.2 Cdd_Intersection (for IsCddPolyhedron, IsCddPolyhedron)

▷ Cdd_Intersection(*P1, P2*)   (operation)

Returns: a CddPolyhedron

The function returns the intersection of P_1 and P_2

```
                                  Example
 gap> A := Cdd_PolyhedronByInequalities( [ [ 3, 4, 5 ] ], [ 1 ] );;
 gap> B := Cdd_PolyhedronByInequalities( [ [ 9, 7, 2 ] ], [ 1 ] );;
 gap> C := Cdd_Intersection( A, B );;
 gap> Display( Cdd_V_Rep( A ) );
 V-representation
 linearity 1, [ 2 ]
 begin
    2 X 3  rational

    1  -3/4    0
    0    -5    4
 end
 gap> Display( Cdd_V_Rep( B ) );
 V-representation
 linearity 1, [ 2 ]
 begin
    2 X 3  rational

    1  -9/7    0
    0    -2    7
 end
 gap> Display( Cdd_V_Rep( C ) );
 V-representation
 begin
    1 X 3  rational

    1  -13/9   5/9
 end
```

2.3.3 \+ (for IsCddPolyhedron, IsCddPolyhedron)

▷ \+(*P1, P2*)   (operation)

   Returns: a CddPolyhedron
   The function returns the Minkuwski sum of P_1 and P_2.

```
                                  Example
 gap> P := Cdd_PolyhedronByGenerators( [ [ 1, 2, 5 ], [ 0, 1, 2 ] ] );
 < Polyhedron given by its V-representation >
 gap> Q := Cdd_PolyhedronByGenerators( [ [ 1, 4, 6 ], [ 1, 3, 7 ], [ 0, 3, 1 ] ] );
 < Polyhedron given by its V-representation >
 gap> S := P+Q;
 < Polyhedron given by its H-representation >
 gap> V := Cdd_V_Rep( S );
 < Polyhedron given by its V-representation >
 gap> Display( V );
 V-representation
 begin
    4 X 3  rational

    0   3   1
    1   6  11
    1   5  12
```

```
     0   1   2
end
gap> Cdd_GeneratingVertices( P );
[ [ 2, 5 ] ]
gap> Cdd_GeneratingVertices( Q );
[ [ 3, 7 ], [ 4, 6 ] ]
gap> Cdd_GeneratingVertices( S );
[ [ 5, 12 ], [ 6, 11 ] ]
gap> Cdd_GeneratingRays( P );
[ [ 1, 2 ] ]
gap> Cdd_GeneratingRays( Q );
[ [ 3, 1 ] ]
gap> Cdd_GeneratingRays( S );
[ [ 1, 2 ], [ 3, 1 ] ]
```

Chapter 3

Linear Programs

3.1 Creating and solving linear programs

3.1.1 Cdd_LinearProgram (for IsCddPolyhedron, IsString, IsList)

▷ Cdd_LinearProgram(*P, str, obj*) (operation)

Returns: a *CddLinearProgram* Object

The function takes three variables. The first is a polyhedron *poly*, the second *str* should be "max" or "min" and the third *obj* is the objective function.

3.1.2 Cdd_SolveLinearProgram (for IsCddLinearProgram)

▷ Cdd_SolveLinearProgram(*lp*) (operation)

Returns: a list if the program is optimal, otherwise returns the value 0

The function takes a linear program. If the program is optimal, the function returns a list of two entries, the solution vector and the optimal value of the objective, otherwise it returns `fail`.

To illustrate the using of these functions, let us solve the linear program given by:
Maximize $P(x,y) = 1 - 2x + 5y$, with
$100 \leq x \leq 200$
$80 \leq y \leq 170$
$y \geq -x + 200$

We bring the inequalities to the form $b + AX \geq 0$, we get:
$-100 + x \geq 0$
$200 - x \geq 0$
$-80 + y \geq 0$
$170 - y \geq 0$
$-200 + x + y \geq 0$

```
―――――――――――――――――――――――――― Example ――――――――――――――――――――――――――
  gap> A:= Cdd_PolyhedronByInequalities( [ [ -100, 1, 0 ], [ 200, -1, 0 ],
  > [ -80, 0, 1 ], [ 170, 0, -1 ], [ -200, 1, 1 ] ] );
  <Polyhedron given by its H-representation>
  gap> lp1:= Cdd_LinearProgram( A, "max", [1, -2, 5 ] );
  <Linear program>
```

```
gap> Display( lp1 );
Linear program given by:
H-representation
begin
   5 X 3  rational

   -100     1     0
    200    -1     0
    -80     0     1
    170     0    -1
   -200     1     1
end
max  [ 1, -2, 5 ]
gap> Cdd_SolveLinearProgram( lp1 );
[ [ 100, 170 ], 651 ]
gap> lp2:= Cdd_LinearProgram( A, "min", [ 1, -2, 5 ] );
<Linear program>
gap> Display( lp2 );
Linear program given by:
H-representation
begin
   5 X 3  rational

   -100     1     0
    200    -1     0
    -80     0     1
    170     0    -1
   -200     1     1
end
min  [ 1, -2, 5 ]
gap> Cdd_SolveLinearProgram( lp2 );
[ [ 200, 80 ], 1 ]
gap> B:= Cdd_V_Rep( A );
<Polyhedron given by its V-representation>
gap> Display( B );
V-representation
begin
   5 X 3  rational

   1  100  170
   1  100  100
   1  120   80
   1  200   80
   1  200  170
end
```

So the optimal solution for lp1 is $(x = 100, y = 170)$ with optimal value $p = 1 - 2(100) + 5(170) = 651$ and for lp2 is $(x = 200, y = 80)$ with optimal value $p = 1 - 2(200) + 5(80) = 1$.

Chapter 4

Attributes and properties

4.1 Attributes and properties of polyhedron

4.1.1 Cdd_Canonicalize (for IsCddPolyhedron)

▷ Cdd_Canonicalize(*P*) (attribute)

Returns: a CddPolyhedron

The function takes a polyhedron and reduces its defining inequalities (generators set) by deleting all redundant inequalities (generators).

```
--------------------------- Example ---------------------------
gap> A:= Cdd_PolyhedronByInequalities( [ [ 0, 2, 6 ], [ 0, 1, 3 ], [1, 4, 10 ] ] );
<Polyhedron given by its H-representation>
gap> B:= Cdd_Canonicalize( A );
<Polyhedron given by its H-representation>
gap> Display( B );
H-representation
begin
   2 X 3  rational

   0   1   3
   1   4  10
end
```

4.1.2 Cdd_V_Rep (for IsCddPolyhedron)

▷ Cdd_V_Rep(*P*) (attribute)

Returns: a CddPolyhedron

The function takes a polyhedron and returns its reduced *V*-representation.

4.1.3 Cdd_H_Rep (for IsCddPolyhedron)

▷ Cdd_H_Rep(*P*) (attribute)

Returns: a CddPolyhedron

The function takes a polyhedron and returns its reduced *H*-representation.

```
--------------------------- Example ---------------------------
gap> A:= Cdd_PolyhedronByInequalities( [ [ 0, 1, 1 ], [ 0, 5, 5 ] ] );
<Polyhedron given by its H-representation>
```

```
gap> B:= Cdd_V_Rep( A );
<Polyhedron given by its V-representation>
gap> Display( B );
V-representation
linearity 1, [ 2 ]
begin
   2 X 3  rational

   0   1   0
   0  -1   1
end
gap> C:= Cdd_H_Rep( B );
<Polyhedron given by its H-representation>
gap> Display( C );
H-representation
begin
   1 X 3  rational

   0  1  1
end
gap> D:= Cdd_PolyhedronByInequalities( [ [ 0, 1, 1, 34, 22, 43 ],
> [ 11, 2, 2, 54, 53, 221 ], [33, 23, 45, 2, 40, 11 ] ] );
<Polyhedron given by its H-representation>
gap> Cdd_V_Rep( D );
<Polyhedron given by its V-representation>
gap> Display( last );
V-representation
linearity 2, [ 5, 6 ]
begin
   6 X 6  rational

   1  -743/14   369/14    11/14        0        0
   0    -1213      619       22        0        0
   0       -1        1        0        0        0
   0      764     -390      -11        0        0
   0   -13526     6772       99      154        0
   0  -116608    59496     1485        0      154
end
```

4.1.4   Cdd_AmbientSpaceDimension (for IsCddPolyhedron)

▷ Cdd_AmbientSpaceDimension(P)   (attribute)

Returns: The dimension of the ambient space of the polyhedron(i.e., the space that contains P).

4.1.5   Cdd_Dimension (for IsCddPolyhedron)

▷ Cdd_Dimension(P)   (attribute)

Returns: The dimension of the polyhedron, where the dimension, $\dim(P)$, of a polyhedron P is the maximum number of affinely independent points in P minus 1.

4.1.6   Cdd_GeneratingVertices (for IsCddPolyhedron)

▷ Cdd_GeneratingVertices(*P*)   (attribute)
    Returns: The reduced generating vertices of the polyhedron

4.1.7   Cdd_GeneratingRays (for IsCddPolyhedron)

▷ Cdd_GeneratingRays(*P*)   (attribute)
    Returns: list
    The output is the reduced generating rays of the polyhedron

4.1.8   Cdd_Equalities (for IsCddPolyhedron)

▷ Cdd_Equalities(*P*)   (attribute)
    Returns: a list
    The output is the reduced equalities of the polyhedron.

4.1.9   Cdd_Inequalities (for IsCddPolyhedron)

▷ Cdd_Inequalities(*P*)   (attribute)

    The output is the reduced inequalities of the polyhedron.

4.1.10   Cdd_InteriorPoint (for IsCddPolyhedron)

▷ Cdd_InteriorPoint(*P*)   (attribute)
    Returns: a list
    The output is an interior point in the polyhedron

4.1.11   Cdd_Faces (for IsCddPolyhedron)

▷ Cdd_Faces(*P*)   (attribute)
    Returns: a list
    This function takes a *H*-represented polyhedron *P* and returns a list. Every entry in this list is again a list, contains the dimension and linearity of the face defined as a polyhedron over the same system of inequalities.

4.1.12   Cdd_FacesWithFixedDimension (for IsCddPolyhedron, IsInt)

▷ Cdd_FacesWithFixedDimension(*P, d*)   (operation)
    Returns: a list
    This function takes a *H*-represented polyhedron *P* and a positive integer *d*. The output is a list. Every entry in this list is the linearity of an *d*- dimensional face of *P* defined as a polyhedron over the same system of inequalities.

4.1.13 Cdd_FacesWithInteriorPoints (for IsCddPolyhedron)

▷ Cdd_FacesWithInteriorPoints(*P*)   (attribute)

 Returns: a list

 This function takes a *H*-represented polyhedron *P* and returns a list. Every entry in this list is a again a list, contains the dimension, linearity of the face defined as a polyhedron over the same system of inequalities and an interior point in the face.

4.1.14 Cdd_FacesWithFixedDimensionAndInteriorPoints (for IsCddPolyhedron, IsInt)

▷ Cdd_FacesWithFixedDimensionAndInteriorPoints(*P, d*)   (operation)

 Returns: a list

 This function takes a *H*-represented polyhedron *P* and a positive integer *d*. The output is a list. Every entry in this list is a again a list, contains the linearity of the face defined as a polyhedron over the same system of inequalities and an interior point in this face.

4.1.15 Cdd_Facets (for IsCddPolyhedron)

▷ Cdd_Facets(*P*)   (attribute)

 Returns: a list

 This function takes a *H*-represented polyhedron *P* and returns a list. Every entry in this is the linearity of a facet defined as a polyhedron over the same system of inequalities.

4.1.16 Cdd_Lines (for IsCddPolyhedron)

▷ Cdd_Lines(*P*)   (attribute)

 Returns: a list

 This function takes a *H*-represented polyhedron *P* and returns a list. Every entry in this is the linearity of a ray (1-dimensional face) defined as a polyhedron over the same system of inequalities.

4.1.17 Cdd_Vertices (for IsCddPolyhedron)

▷ Cdd_Vertices(*P*)   (attribute)

 Returns: a list

 This function takes a *H*-represented polyhedron *P* and returns a list. Every entry in this list is the linearity of a vertex defined as a polyhedron over the same system of inequalities.

4.1.18 Cdd_IsEmpty (for IsCddPolyhedron)

▷ Cdd_IsEmpty(*P*)   (property)

 Returns: true or false

 The output is `true` if the polyhedron is empty and `false` otherwise

4.1.19 Cdd_IsCone (for IsCddPolyhedron)

▷ Cdd_IsCone(*P*)   (property)

 Returns: true or false

 The output is `true` if the polyhedron is cone and `false` otherwise

4.1.20 Cdd_IsPointed (for IsCddPolyhedron)

▷ Cdd_IsPointed(*P*) (property)

   Returns: true or false

   The output is true if the polyhedron is pointed and false otherwise

```
——————————— Example ———————————
gap> poly:= Cdd_PolyhedronByInequalities( [ [ 1, 3, 4, 5, 7 ], [ 1, 3, 5, 12, 34 ],
> [ 9, 3, 0, 2, 13 ]  ], [ 1 ] );
<Polyhedron given by its H-representation>
gap> Cdd_InteriorPoint( poly );
[ -194/75, 46/25, -3/25, 0 ]
gap> Cdd_FacesWithInteriorPoints( poly );
[ [ 3, [ 1 ], [ -194/75, 46/25, -3/25, 0 ] ], [ 2, [ 1, 2 ],
[ -62/25, 49/25, -7/25, 0 ] ], [ 1, [ 1, 2, 3 ],
[ -209/75, 56/25, -8/25, 0 ] ], [ 2, [ 1, 3 ], [ -217/75, 53/25, -4/25, 0 ] ] ]
gap> Cdd_Dimension( poly );
3
gap> Cdd_IsPointed( poly );
